Assignment 5

Problem Statement:

Implement Agglomerative hierarchical clustering algorithm using appropriate dataset.

Objective:

- Evaluate and analyze the working of Agglomerative hierarchical clustering algorithm.
- To study working of dendrograms.

Theory:

Prerequisites: Agglomerative Clustering Algorithm,

Dataset: Credit Card Dataset.

Assumption: The clustering technique assumes that each data point is similar enough to the other data points that the data at the starting can be assumed to be clustered in 1 cluster.

Step 1: Importing the required libraries

importpandas as pd

importnumpy as np

importmatplotlib.pyplot as plt

from sklearn.decomposition import PCA

fromsklearn.clusterimportAgglomerativeClustering

fromsklearn.preprocessingimportStandardScaler, normalize

fromsklearn.metricsimportsilhouette_score

importscipy.cluster.hierarchy as shc

Step 2: Loading and Cleaning the data

Changing the working location to the location of the file

cd C:\Users\Dev\Desktop\Kaggle\Credit_Card

X =pd.read csv('CC GENERAL.csv')

Dropping the CUST_ID column from the data

 $X = X.drop('CUST_ID', axis = 1)$

Handling the missing values

X.fillna(method ='ffill', inplace=True)

Step 3: Preprocessing the data

Scaling the data so that all the features become comparable scaler = StandardScaler()

X_scaled=scaler.fit_transform(X)

Normalizing the data so that the data approximately

follows a Gaussian distribution

X normalized=normalize(X scaled)

Converting the numpy array into a pandas DataFrame

X normalized=pd.DataFrame(X normalized)

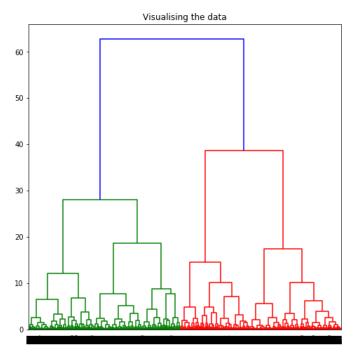

Step 4: Reducing the dimensionality of the Data

pca=PCA(n_components=2)
X_principal=pca.fit_transform(X_normalized)
X_principal=pd.DataFrame(X_principal)
X_principal.columns=['P1', 'P2']

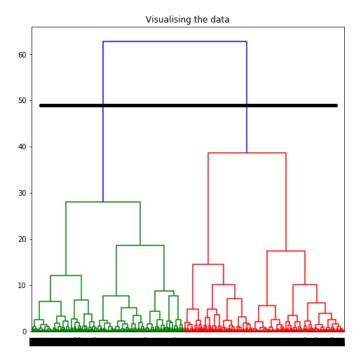

Dendrograms are used to divide a given cluster into many different clusters.

Step 5: Visualizing the working of the Dendrograms

plt.figure(figsize=(8, 8))
plt.title('Visualising the data')
Dendrogram = shc.dendrogram((shc.linkage(X_principal, method = 'ward')))

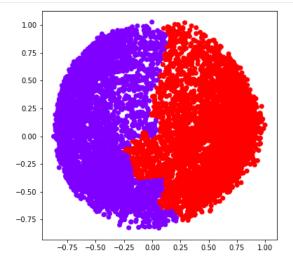

To determine the optimal number of clusters by visualizing the data, imagine all the horizontal lines as being completely horizontal and then after calculating the maximum distance between any two horizontal lines, draw a horizontal line in the maximum distance calculated.

The above image shows that the optimal number of clusters should be 2 for the given data.

Step 6: Building and Visualizing the different clustering models for different values of k a) k = 2

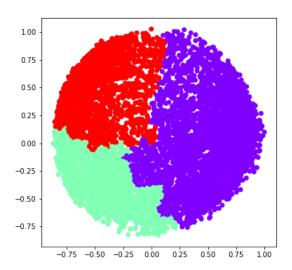

b) **k** = **3**ac3 =AgglomerativeClustering(n_clusters=3)

plt.figure(figsize=(6, 6))

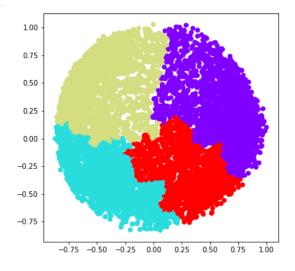

plt.scatter(X_principal['P1'], X_principal['P2'],

c =ac3.fit_predict(X_principal), cmap='rainbow')
plt.show()

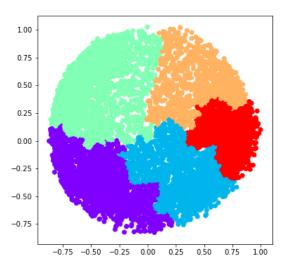

c) k = 4

ac4 =AgglomerativeClustering(n_clusters=4)

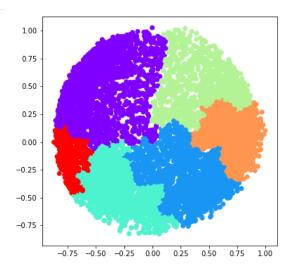

d) k = 5

ac5 =AgglomerativeClustering(n_clusters=5)

e) k = 6

```
ac6 =AgglomerativeClustering(n_clusters=6)
```

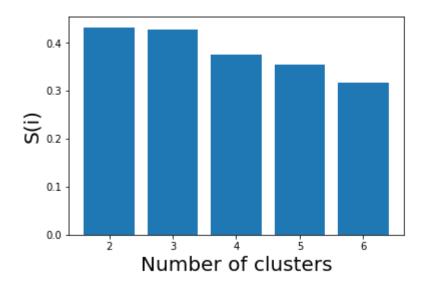

We now determine the optimal number of clusters using a mathematical technique. Here, we will use the **Silhouette Scores** for the purpose.

Step 7: Evaluating the different models and Visualizing the results.

```
k = [2, 3, 4, 5, 6]
```

Appending the silhouette scores of the different models to the list
silhouette_scores=[]
silhouette_scores.append(
 silhouette_score(X_principal, ac2.fit_predict(X_principal)))
silhouette_scores.append(
 silhouette_score(X_principal, ac3.fit_predict(X_principal)))

Thus, with the help of the silhouette scores, it is concluded that the optimal number of clusters for the given data and clustering technique is 2.

Conclusion:

In this way, we have studied Agglomerative hierarchical clustering algorithm using appropriate dataset.
